

# ENERGY & RESOURCES

## Renewable Energy

A challenge was presented when a client wanted to replicate a wind turbine and have the propeller spin as well. A four part mold was created to make all the stone components. All of the pieces were then assembled and a bearing was embedded in the piece, which allowed the propeller to spin. Custom-cut acrylic was imprinted with our UV printer and assembled to the stone piece making a truly one-of-a-kind award.

## Project Completion

Our client was looking for a desk-sized commemorative to celebrate the completion of a large project. Using only stone material we created a custom-cut state shape that was UV printed with a distinct graphic. The piece was then mounted to a stone base which was in-turn, coated metallic silver to emulate metal. When combined, the piece made a striking award that gave the appearance of complimentary materials.

## Awards & Recognition

A petroleum company was looking for a unique star award that tied into their "Rising Star" theme. They immediately fell in love with our Rocky Star Award. The combination of the polished star and rock base lent itself perfectly to the petroleum company using it. The imprint was etched and color filled and we PMS color matched their corporate logo which added the final touch.
